**COVER LETTER**

Honorable Assistant Commissioner:

Enclosed herewith please find the following documents comprising a United States patent application: (1) specification, claims and drawings, (2) fee calculation sheet, (3) fee, (4) declaration of inventor, (5) statements of small entity status, (6) information disclosure statement, and (7) return receipt postcard.

Because the inventors are presently unavailable, the declarations, including the small entity status, are submitted unsigned. Applicant intends to file signed declarations including the declarations claiming small entity status within the permitted time after receiving a Notice of Missing Parts.

Respectfully submitted this 10<sup>th</sup> day of October, 2000.

**FEE CALCULATION SHEET**

Honorable Assistant Commissioner:

The fee for the accompanying patent application is calculated as follows:

Basic Filing Fee (small entity) .....	\$ 355.00
Independent claims in excess of three .....	\$ 0.00
( 0 x 40.00 each)	
Claims in excess of twenty .....	\$ 0.00
( 0 x 9.00)	
Recordation of Assignment .....	\$ 0.00
Recordation of Assignment .....	\$ 0.00
 TOTAL .....	 <i>\$ 355.00</i>

A check for this amount is enclosed.  
 Respectfully submitted this 10<sup>th</sup> day of October, 2000.

**VERIFIED STATEMENT (DECLARATION)  
CLAIMING SMALL ENTITY STATUS****--INDEPENDENT INVENTOR--  
(37 CFR 1.9(c), (f) and 1.27(b))**

Honorable Assistant Commissioner:

As the below named inventor, I hereby declare that I qualify as an independent inventor as defined in 37 CFR § 1.9(c) for the purposes of paying reduced fees under section 41(a) and (b) of Title 35, United States Code, to the Patent and Trademark Office with regard to the invention entitled **METHOD AND APPARATUS FOR MONITORING DYNAMIC CARDIOVASCULAR FUNCTION USING N-DIMENSIONAL REPRESENTATIONS OF CRITICAL FUNCTIONS** described in a patent application filed herewith.

I have not assigned, granted, conveyed or licensed and I am not under any obligation under contract or law to assign, grant, convey or license any rights in the invention to any person who could not be classified as an independent inventor under 37 CFR § 1.9(c) if that person had made the invention, or to any concern which would not qualify as a small business concern under 37 CFR § 1.9(d) or a nonprofit organization under 37 CFR § 1.9(e).

I acknowledge the duty to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the due date on which status as a small entity is no longer appropriate. (37 CFR § 1.28(b)).

I hereby declare that all statements made herein are of my own knowledge and are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application, any patent issuing thereon, or any patent to which this verified statement is directed.

**VERIFIED STATEMENT (DECLARATION)  
 CLAIMING SMALL ENTITY STATUS**

**--SMALL BUSINESS CONCERN--  
 (37 CFR 1.9(f) AND 1.27(c))**

Honorable Assistant Commissioner:

I hereby declare that I am

- the owner of the small business concern identified below:
- an official of the small business concern identified below and that I am empowered to act on behalf of said corporation:

NAME OF CONCERN: University of Utah

ADDRESS OF CONCERN: 421 Wakara Way, Suite 170

Salt Lake City, Utah 84108

I hereby declare that the above organization qualifies as a nonprofit organization as defined in 37 CFR § 1.9(f) and § 1.27(d) for purposes of paying reduced fees under section 41(a) and (b) of Title 35, United States Code in that the nonprofit organization identified above qualifies as a nonprofit organization as defined in 37 CFR § 1.9(e).

I hereby declare that rights under contract or law have been conveyed to and remain with the small business concern identified above with regard to the invention, entitled **METHOD AND APPARATUS FOR MONITORING DYNAMIC CARDIOVASCULAR FUNCTION USING N-DIMENSIONAL REPRESENTATIONS OF CRITICAL FUNCTIONS** by the above-named inventors described in

- the specification filed with this declaration.
- application Serial No. \_\_\_\_\_, filed \_\_\_\_\_ .
- Patent No. \_\_\_\_\_, issued \_\_\_\_\_ .

If the rights held by the above-identified small business concern are not exclusive, each individual, concern or organization having rights to the invention is listed below and no rights to the invention are held by any person, other than the inventor, who could not qualify as an independent inventor under 37 CFR § 1.9(c) if that person made the invention, or by any concern which would not qualify as a small business concern under 37 CFR § 1.9(d), or a nonprofit organization under 37 CFR § 1.9(e).

- no such person, concern or organization exists.
- each such person, concern or organization is listed below:

NAME: University of Utah Research Foundation  
ADDRESS: 210 Park Building  
Salt Lake City, Utah 84112

- INDIVIDUAL
- SMALL BUSINESS ENTITY
- NONPROFIT ORGANIZATION

I acknowledge the duty of the small business concern to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the due date on which status as a small entity is no longer appropriate. (37 CFR § 1.28(b)).

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application, any

patent issuing thereon, or any patent to which this verified statement is directed.

Lloyd W. Sadler (Reg. No. 40,154)

2025 RELEASE UNDER E.O. 14176

**SPECIFICATION**

1

2

3 To all whom it may concern:

4 Be it known that James Agutter, a citizen of the United States of America,

5 Dwayne R. Westenskow, a citizen of the United States of America, Noah Syroid, a

6 citizen of the United States of America, Julio C. Bermudez, a citizen of Argentina, and

7 Yinqi Zhang, a citizen of the People's Republic of China, have invented a new and useful

8 invention entitled "METHOD AND APPARATUS FOR MONITORING DYNAMIC

9 CARDIOVASCULAR FUNCTION USING N-DIMENSIONAL REPRESENTATIONS

10 OF CRITICAL FUNCTIONS" of which the following comprises a complete

11 specification.

12 This patent application is a continuation-in-part patent application of U.S. Patent

13 Application Serial Number 09/457,068, which was filed on December 7, 1999, and which

14 is presently pending before the United States Patent and Trademark Office. Priority is

15 hereby claimed to all material disclosed in this parent case.

16

1           **METHOD AND APPARATUS FOR MONITORING DYNAMIC**

2           **CARDIOVASCULAR FUNCTION USING N-DIMENSIONAL**

3           **REPRESENTATIONS OF CRITICAL FUNCTIONS**

4

5           **Background of the Invention**

6       **Field of the Invention.** This invention relates to the visualization, perception,

7       representation and computation of data relating to the attributes or conditions constituting

8       the health state of a dynamic system. More specifically, this invention relates to the

9       display and computation of cardiovascular data, in which variables constituting attributes

10      and conditions of a dynamic physiological system can be interrelated and visually

11      correlated in time as three-dimensional objects.

12      **Description of the Related Art.** A variety of methods and systems for the visualization

13      of data have been proposed. Traditionally, these methods and systems fail to present in a

14      real-time multi-dimensional format that is directed to facilitating a user's analysis of

15      multiple variables and the relationships between such multiple variables. Moreover, such

16      prior methods and systems tend not to be specifically directed to display of a patient's

17      cardiovascular system by showing such cardiovascular variables as blood pressure, blood

18      flow, vascular tone and the like. Prior methods typically do not process and display data

19      in real-time, rather they use databases or spatial organizations of historical data.

20      Generally, they also simply plot existing information in two or three dimensions, but

21      without using three-dimensional geometric objects to show the interrelations between

22      data. Often previous systems and methods are limited to pie charts, lines or bars to

23      represent the data. Also, many previous systems are limited to particular applications or

1 types of data. The flexibility and adaptability of the user interface and control is typically  
2 very limited, and may not provide flexible coordinate systems and historical-trend  
3 monitors. Other systems, which have a flexible user interface, generally require  
4 substantial user expertise in order to collect and evaluate the data, including the pre-  
5 identification of data ranges and resolution. Another common limitation of previous  
6 systems and methods is that they provide only a single or predetermined viewpoint from  
7 which to observe the data. Typically, prior systems and methods do not provide data  
8 normalcy frameworks to aid in the interpretation of the data. Furthermore, most prior  
9 methods use “icons,” shapes, lines, bars, or graphs. For general background material, the  
10 reader is directed to United States Patent Nos. 3,908,640, 4,193,393, 4,464,122,  
11 4,519,395, 4,619,269, 4,752,893, 4,772,882, 4,813,013, 4,814,755, 4,823,283, 4,832,038,  
12 4,875,165, 4,880,013, 4,915,757, 4,930,518, 4,989,611, 5,012,411, 5,021,976, 5,103,828,  
13 5,121,469, 5,162,991, 5,222,020, 5,224,481, 5,262,944, 5,317,321, 5,425,372, 5,491,779,  
14 5,568,811, 5,588,104, 5,592,195, 5,596,694, 5,626,141, 5,634,461, 5,751,931, 5,768,552,  
15 5,774,878, 5,796,398, 5,812,134, 5,830,150, 5,836,884, 5,913,826, 5,923,330, 5,961,467,  
16 6,042,548, and 6,090,047 each of which is hereby incorporated by reference in its entirety  
17 for the material disclosed therein.

18 As this disclosure employs a number of terms, which may be new to the reader,  
19 the reader is directed to the applicants’ definitions section, which is provided at the  
20 beginning of the detailed description section.

21 **Summary of the Invention**

22 It is desirable to provide a method, system, and apparatus, which facilitates the  
23 rapid and accurate analysis of complex and quickly changing data. Moreover, it is

1 desirable that such a system and method include a graphic element that depicts the status  
2 of a patient's cardiovascular system by graphically showing blood pressure, blood flow,  
3 vascular tone and other cardiovascular variables. It is important that such a graphic  
4 element provide an anesthesiologist with the means to quickly assess the patient's status.  
5 It is also desirable that the element be comprised of subcomponents, which are linked  
6 together to show thereby the relationships of the various cardiovascular variables. Also,  
7 it is desirable that system and method be capable of analyzing time based, real-time, and  
8 historical data and that it be able to graphically show the relationships between various  
9 data.

10 Research studies have indicated that the human mind is better able to analyze and  
11 use complex data when it is presented in a graphic, real world type representation, rather  
12 than when it is presented in textual or numeric formats. Research in thinking,  
13 imagination and learning has shown that visualization plays an intuitive and essential role  
14 in assisting a user associate, correlate, manipulate and use information. The more  
15 complex the relationship between information, the more critically important is the  
16 communication, including audio and visualization of the data. Modern human factors  
17 theory suggests that effective data representation requires the presentation of information  
18 in a manner that is consistent with the perceptual, cognitive, and response-based mental  
19 representations of the user. For example, the application of perceptual grouping (using  
20 color, similarity, connectedness, motion, sound etc.) can facilitate the presentation of  
21 information that should be grouped together. Conversely, a failure to use perceptual  
22 principles in the appropriate ways can lead to erroneous analysis of information.

1       The manner in which information is presented also affects the speed and accuracy  
2       of higher-level cognitive operations. For example, research on the “symbolic distance  
3       effect” suggests that there is a relationship between the nature of the cognitive decisions  
4       (for example, is the data increasing or decreasing in magnitude?) and the way the  
5       information is presented (for example, do the critical indices become larger or smaller, or  
6       does the sound volume or pitch rise or fall?). Additionally, “population stereotypes”  
7       suggest that there are ways to present information that are compatible with well-learned  
8       interactions with other systems (for example, an upwards movement indicates an  
9       increasing value, while a downwards movement indicates a decreasing value).

10       Where there is compatibility between the information presented to the user and  
11       the cognitive representations presented to the user, performance is often more rapid,  
12       accurate, and consistent. Therefore, it is desirable that information be presented to the  
13       user in a manner that improves the user’s ability to process the information and  
14       minimizes any mental transformations that must be applied to the data.

15       Therefore, it is the general object of this invention to provide a method and  
16       systems for presenting a three-dimensional visual and/or possibly an audio display  
17       technique that assists a doctor in the monitoring of a patient’s cardiovascular function.

18       It is a further object of this invention to provide a method and system that assists  
19       in the monitoring of a patient’s cardiovascular system through the use of a three-  
20       dimensional graphic element.

21       It is another object of this invention to provide a method and system that assists in  
22       the management of anesthesia care of patients, by presenting a display, which quickly  
23       shows the relationships of various cardiovascular variables.

1        It is a still further object of this invention to provide a method and system that  
2    assists in the determination of the “health” of a dynamic cardiovascular system, by  
3    providing visual information related to the nature or quality of the soundness, wholeness,  
4    or well-being of the system as related to historical or normative values.

5        Another object of this invention is to provide a method and system that assists in  
6    the determination of the functioning of a cardiovascular system by measuring the  
7    interaction among a set of “vital-signs” normally associated with the health of the  
8    cardiovascular system.

9        A still further object of this invention is to provide a method and system, which  
10   provides the gathering and use of sensor measured data, as well as the formatting and  
11   normalization of the data in a format suitable to the processing methodology.

12        A further object of this invention is to provide a method and system, which  
13   organizes a cardiovascular system’s data into relevant data sets or critical functions as  
14   appropriate.

15        Another object of this invention is to provide a method and system, which  
16   provides a three-dimensional health-space for mapping the cardiovascular system data.

17        It is another object of this invention to provide a method and system, which  
18   provides three-dimensional objects that are symbols of the critical functioning of the  
19   cardiovascular system being monitored.

20        It is an object of this invention to provide a method and system that shows the  
21   relationships between several critical functions that a user wishes to monitor.

1 It is a further object of this invention to provide a method and system that permits  
2 an integrated and overall holistic understanding of the cardiovascular process being  
3 monitored.

4 A further object of this invention is to provide a method and system where three-  
5 dimensional objects are built from three-dimensional object primitives, including: cubes,  
6 spheres, pyramids, n-polygon prisms, cylinders, slabs.

7 A still further object of this invention is to provide a method and system, wherein  
8 three-dimensional objects are placed within health-space based on the coordinates of their  
9 geometric centers, edges, vertices, or other definite geometric variables.

10 It is a further object of this invention to provide a method and system, which has  
11 three-dimensional objects that have three spatial dimensions, as well as geometric,  
12 aesthetic and aural attributes, to permit the mapping of multiple data functions.

13 It is another object of this invention to provide a method and system, which shows  
14 increases and decreases in data values using changes in location, size, form, texture,  
15 opacity, color, sound and the relationships thereof in their context.

16 It is a still further object of this invention to provide a method and system,  
17 wherein the particular three-dimensional configuration of three-dimensional objects can  
18 be associated with a particular time and health state.

19 A still further object of this invention is to provide a method and system that  
20 permits the simultaneous display of the history of data objects.

21 Another object of this invention is to provide a method and system that provides  
22 for the selection of various user selectable viewports.

1        It is a further object of this invention to provide a method and system that  
2    provides both a global and a local three-dimensional coordinate space.

3        It is another object of this invention to provide a method and system that permits  
4    the use of time as one of the coordinates.

5        It is a still further object of this invention to provide a method and system that  
6    provides a reference framework of normative values for direct comparison with the  
7    measured data.

8        It is a further object of this invention to provide a method and system where  
9    normative values are based on the average historical behavior of a wide population of  
10   healthy systems similar to the system whose health is being monitored.

11       A further object of this invention is to provide a method and system that provides  
12   viewpoints that can be selected to be perspective views, immersive Virtual Reality views,  
13   or any orthographic views.

14       Another object of this invention is to provide a method and system that permits  
15   the display of a layout of multiple time-space viewpoints.

16       A still further object of this invention is to provide a method and system that  
17   provides for zooming in and out of a time and/or space coordinate.

18       It is another object of this invention to provide a method and system that permits  
19   temporal and three-dimensional modeling of data “health” states based on either pre-  
20   recorded data or real-time data, that is as the data is obtained.

21       Another object of this invention is to provide a method and system that presents  
22   the data in familiar shapes, colors, and locations to enhance the usability of the data.

1 A still further object of the invention is to provide a method and system that uses  
2 animation, and sound to enhance the usefulness of the data to the user.

3 It is an object of this invention to provide a method and system for the  
4 measurement, computation, display and user interaction, of complex data sets that can be  
5 communicated and processed at various locations physically remote from each other,  
6 over a communication network, as necessary for the efficient utilization of the data and  
7 which can be dynamically changed or relocated as necessary.

8 It is a still further object of this invention to provide a method and system for the  
9 display of data that provides both a standard and a customized interface mode, thereby  
10 providing user and application flexibility.

These and other objects of this invention are achieved by the method and system  
herein described and are readily apparent to those of ordinary skill in the art upon careful  
review of the following drawings, detailed description and claims.

### **Brief Description of the Drawings**

15 In order to show the manner that the above recited and other advantages and  
16 objects of the invention are obtained, a more particular description of the preferred  
17 embodiment of the invention, which is illustrated in the appended drawings, is described  
18 as follows. The reader should understand that the drawings depict only a preferred  
19 embodiment of the invention, and are not to be considered as limiting in scope. A brief  
20 description of the drawings is as follows:

21 Figure 1a is a top-level representative diagram showing the data processing paths  
22 of the preferred embodiment of this invention.

1       Figure 1b is a top-level block diagram of the data processing flow of the preferred  
2 embodiment of this invention.

3       Figure 1c is a top-level block diagram of one preferred processing path of this  
4 invention.

5       Figure 1d is a top-level block diagram of a second preferred processing path of  
6 this invention.

7       Figures 2a, 2b, 2c, and 2d are representative 3-D objects representing critical  
8 functions.

9       Figure 3 is a representation of data objects in H-space.

10      Figures 4a and 4b are representative views of changes in data objects in time.

11      Figures 5a, 5b, 5c, 5d, 5e, 5f, 5g and 5h are representative views of properties of  
12 data objects provided in the preferred embodiment of this invention.

13      Figure 6 shows a 3-D configuration of the objects in H-space in the preferred  
14 embodiment of the invention.

15      Figure 7 shows H-space with a time coordinate along with local-space  
16 coordinates.

17      Figures 8a and 8b show the global level coordinate system of the preferred  
18 embodiment of this invention.

19      Figures 9a and 9b show various viewpoints of the data within H-space in the  
20 preferred embodiment of this invention.

21      Figure 10 shows the transformation of an object in space in context, with a  
22 reference framework, in the preferred embodiment of this invention.

23      Figure 11a shows the zooming out function in the invention.

1       Figure 11b shows the zooming in function in the invention.

2       Figures 12a and 12b show a 3-D referential framework of normative values.

3       Figure 13 shows the interface modes of the preferred embodiment of this

4       invention.

5       Figure 14 is a hardware system flow diagram showing various hardware  
6       components of the preferred embodiments of the invention.

7       Figure 15 is a software flow chart showing the logic steps of a preferred  
8       embodiment of the invention.

9       Figure 16 is a software block diagram showing the logic steps of the image  
10      computation and rendering process of a preferred embodiment of the invention.

11       Figure 17 is a photograph of the 3-dimensional display of a preferred embodiment  
12      of the invention.

13       Figure 18 is a close-up front view of the cardiac object and the associated  
14      reference grid of a preferred embodiment of the invention.

15       Figure 19 is a view of the front view portion of the display of a preferred  
16      embodiment of the present invention showing the cardiac object in the foreground and  
17      the respiratory object in the background.

18       Figure 20 is a view of the top view portion of the display of a preferred  
19      embodiment of the present invention showing the cardiac object toward the bottom of the  
20      view and the respiratory object toward the top of the view.

21       Figure 21 is a view of the side view portion of the display of a preferred  
22      embodiment of the present invention showing the cardiac object to the left and the  
23      respiratory object to the right.

1       Figure 22 is a view of the 3-D perspective view portion of the display of a  
2 preferred embodiment of the invention showing the cardiac object in the left foreground  
3 and the respiratory object in the right background.

4       Figure 23a is a view of the preferred graphic element of this invention in a normal  
5 cardiovascular system.

6       Figure 23b is a view of the preferred graphic element of this invention in a  
7 cardiovascular system showing anaphylaxis.

8       Figure 23c is a view of the preferred graphic element of this invention in a  
9 cardiovascular system showing hypovolemia.

10      Figure 23d is a view of the preferred graphic element of this invention in a  
11 cardiovascular system showing bradycardia.

12      Figure 23e is a view of the preferred graphic element of this invention in a  
13 cardiovascular system showing ischemia.

14      Figure 23f is a view of the preferred graphic element of this invention in a  
15 cardiovascular system showing pulmonary embolism.

16      Figure 24 is a view of the preferred reference grid of this embodiment of the  
17 invention.

18      Figure 25 is a view of the preferred reference grid showing object placement in  
19 this preferred embodiment of the invention.

20      Figure 26 is a view of the preferred reference grid showing the functional object  
21 relationships in this preferred embodiment of the invention.

22      Figure 27 is a representative three-dimensional object used in the present  
23 preferred embodiment of the invention.

Figure 28 is a representative view of the normalization of the present preferred embodiment of the invention.

3 Figure 29 is an integrated view showing numeric information in the present  
4 preferred embodiment of the invention.

5 Figure 30 is a view showing the addition of slopes to show the restriction of blood  
6 vessels.

7 Reference will now be made in detail to the present preferred embodiment of the  
8 invention, examples of which are illustrated in the accompanying drawings.

#### **Detailed Description of the Invention**

This invention is a method, system and apparatus for the visual display of complex sets of dynamic data. In particular, this invention provides the means for efficiently analyzing, comparing and contrasting data, originating from either natural or artificial systems. In its most common use the preferred embodiment of this invention is used to produce an improved cardiovascular display of a human or animal patient. This invention provides n-dimensional visual representations of data through innovative use of orthogonal views, form, space, frameworks, color, shading, texture, transparency, sound and visual positioning of the data. The preferred system of this invention includes one or a plurality of networked computer processing and display systems, which provide real-time as well as historical data, and which processes and formats the data into an audio-visual format with a visual combination of objects and models with which the user can interact to enhance the usefulness of the processed data. While this invention is applicable to a wide variety of data analysis applications, one important application is the analysis of health data. For this reason, the example of a medical application for this

1 invention is used throughout this description. The use of this example is not intended to  
2 limit the scope of this invention to medical data analysis applications only, rather it is  
3 provided to give a context to the wide range of potential application for this invention.

4 This invention requires its own lexicon. For the purposes of this patent  
5 description and claims, the inventors intend that the following terms be understood to  
6 have the following definitions.

7 An “artificial system” is an entity, process, combination of human designed parts,  
8 and/or environment that is created, designed or constructed by human intention.

9 Examples of artificial systems include manmade real or virtual processes, computer  
10 systems, electrical power systems, utility and construction systems, chemical processes  
11 and designed combinations, economic processes (including, financial transactions),  
12 agricultural processes, machines, and human designed organic entities.

13 A “natural system” is a functioning entity whose origin, processes and structures  
14 were not manmade or artificially created. Examples of natural systems are living  
15 organisms, ecological systems and various Earth environments.

16 The “health” of a system is the state of being of the system as defined by its  
17 freedom from disease, ailment, failure or inefficiency. A diseased or ill state is a  
18 detrimental departure from normal functional conditions, as defined by the nature or  
19 specifications of the particular system (using historical and normative statistical values).

20 The health of a functioning system refers to the soundness, wholeness, efficiency or well  
21 being of the entity. Moreover, the health of a system is determined by its functioning.

22 “Functions” are behaviors or operations that an entity performs. Functional  
23 fitness is measures by the interaction among a set of “vital-signs” normally taken or

1 measured using methods well known in the art, from a system to establish the system's  
2 health state, typically at regular or defined time intervals.

3 "Health-space" or "H-space" is the data representation environment that is used to  
4 map the data in three or more dimensions.

5 "H-state" is a particular 3-D configuration or composition that the various 3-D  
6 objects take in H-space at a particular time. In other words, H-state is a 3-D snapshot of  
7 the system's health at one point of time.

8 "Life-space" or "L-space" provides the present and past health states of a system  
9 in a historical and comparative view of the evolution of the system in time. This 3-D  
10 representation environment constitutes the historical or Life-space of a dynamic system.  
11 L-space allows for both continuous and categorical displays of temporal dependent  
12 complex data. In other words, L-space represents the health history or trajectory of the  
13 system in time.

14 "Real-Time Representation" is the display of a representation of the data within a  
15 fraction of a second from the time when the event of the measured data occurred in the  
16 dynamic system.

17 "Real-Time User Interface" is the seemingly instantaneous response in the  
18 representation due to user interactivity (such as rotation and zooming).

19 A "variable" is a time dependent information unit (one unit per time increment)  
20 related to sensing a given and constant feature of the dynamic system.

21 "Vital signs" are key indicators that measure the system's critical functions or  
22 physiology.

1        In the preferred embodiments of this invention, data is gathered using methods or  
2        processes well known in the art or as appropriate and necessary. For example, in general,  
3        physiologic data, such as heart rate, respiration rate and volume, blood pressure, and the  
4        like, is collected using the various sensors that measure the functions of the natural  
5        system. Sensor-measured data is electronically transferred and translated into a digital  
6        data format to permit use by the invention. This invention uses the received measured  
7        data to deliver real-time and/or historical representations of the data and/or recorded data  
8        for later replay. Moreover, this invention permits the monitoring of the health of a  
9        dynamic system in a distributed environment. By distributed environment, it is meant  
10      that a user or users interacting with the monitoring system may be in separate locations  
11      from the location of the dynamic system being monitored. In its most basic elements, the  
12      monitoring system of this invention has three major logical components: (1) the sensors  
13      that measure the data of the system; (2) the networked computational information  
14      systems that computes the representation and that exchanges data with the sensors and  
15      the user interface; and (3) the interactive user interface that displays the desired  
16      representation and that interactively accepts the users' inputs. The components and  
17      devices that perform the three major functions of this invention may be multiple, may be  
18      in the same or different physical locations, and/or may be assigned to a specific process  
19      or shared by multiple processes.

20        Figure 1a is a top-level representative diagram showing the data processing paths  
21        of the preferred embodiment of this invention operating on a natural system. The natural  
22        system 101a is shown as a dynamic entity whose origin, processes and structures  
23        (although not necessarily its maintenance) were not manmade or artificially created.

1 Examples of natural systems are living organisms, ecological systems, and various Earth  
2 environments. In one preferred embodiment of the invention, a human being is the  
3 natural system whose physiology is being monitored. Attached to the natural system  
4 101a are a number of sensors 102. These sensors 102 collect the physiologic data,  
5 thereby measuring the selected critical functions of the natural system. Typically, the  
6 data gathering of the sensors 102 is accomplished with methods or techniques well  
7 known in the art. The sensors 102 are typically and preferably electrically connected to a  
8 digital data formatter 103. However, in other embodiments of this invention, the sensors  
9 may be connected using alternative means including but not limited to optical, RF and the  
10 like. In many instances, this digital data formatter 103 is a high-speed analog to digital  
11 converter. Also, connected to the digital data formatter 103 is the simulator 101b. The  
12 simulator 101b is an apparatus or process designed to simulate the physiologic process  
13 underlying the life of the natural system 101a. A simulator 101b is provided to generate  
14 vital sign data in place of a natural system 101a, for such purposes as education, research,  
15 system test, and calibration. The output of the digital data formatter 103 is Real-Time  
16 data 104. Real-Time data 104 may vary based on the natural system 101a being  
17 monitored or the simulator 101b being used and can be selected to follow any desired  
18 time frame, for example time frames ranging from one-second periodic intervals, for the  
19 refreshment rates of patients in surgery, to monthly statistics reporting in an ecological  
20 system. The Real-Time data 104 is provided to a data recorder 105, which provides the  
21 means for recording data for later review and analysis, and to a data modeling processor  
22 and process 108. In the preferred embodiments of this invention the data recorder 105  
23 uses processor controlled digital memory, and the data modeling processor and process

1 108 is one or more digital computer devices, each having a processor, memory, display,  
2 input and output devices and a network connection. The data recorder 105 provides the  
3 recorded data to a speed controller 106, which permits the user to speed-up or slow-down  
4 the replay of recorded information. Scalar manipulations of the time (speed) in the  
5 context of the 3-D modeling of the dynamic recorded digital data allows for new and  
6 improved methods or reviewing the health of the systems 101a,b. A customize /  
7 standardize function 107 is provided to permit the data modeling to be constructed and  
8 viewed in a wide variety of ways according to the user's needs or intentions.

9 Customization 107 includes the ability to modify spatial scale, such modifying includes  
10 but is not limited to zooming, translating, and rotating, attributes and viewports in  
11 addition to speed. In one preferred embodiment of the invention, the range of  
12 customization 107 permitted for monitoring natural systems 101a physiologic states is  
13 reduced and is heavily standardized in order to ensure that data is presented in a common  
14 format that leads to common interpretations among a diverse set of users. The data  
15 modeling processor and process 108 uses the prescribed design parameters, the  
16 standardized/customize function and the received data to build a three-dimensional (3-D)  
17 model in real-time and to deliver it to an attached display. The attached display of the  
18 data modeling processor and process 108 presents a representation 109 of 3-D objects in  
19 3-D space in time to provide the visual representation of the health of the natural system  
20 101a in time, or as in the described instances of the simulated 101b system.

21 Figure 1b is a top-level block diagram of the data processing flow of the  
22 preferred embodiment of this invention operating on an artificial system. An artificial  
23 system is a dynamic entity whose origin, processes and structure have been designed and

1 constructed by human intention. Examples of artificial systems are manmade real or  
2 virtual, mechanical, electrical, chemical and/or organic entities. The artificial system  
3 110a is shown attached to a number of sensors 111. These sensors 111 collect the  
4 various desired data, thereby measuring the selected critical functions of the artificial  
5 system. Typically, the data gathering of the sensors 111 is accomplished with methods or  
6 techniques well known in the art. The sensors 111 are connected to a data formatter 112,  
7 although alternative connection means including optical, RF and the like may be  
8 substituted without departing from the concept of this invention. In many instances, this  
9 digital data formatter 112 is a high-speed analog to digital converter. Although, in certain  
10 applications of the invention, namely stock market transactions, the data is communicated  
11 initially by people making trades. Also connected to the digital data formatter 112 is the  
12 simulator 110b. The simulator 110b is an apparatus or process designed to simulate the  
13 process underlying the state of the artificial system 110a. The simulator 110b is provided  
14 to generate vital data in place of the artificial system 110a, for such purposes as  
15 education, research, system test, and calibration. The output of the digital data formatter  
16 112 is Real-Time data 113. Real-Time data 113 may vary based on the artificial system  
17 110a being monitored or the simulator 110b being used and can be selected to follow any  
18 desired time frame, for example time frames ranging from microsecond periodic  
19 intervals, for the analysis of electronic systems, to daily statistics reported in an financial  
20 trading system. The Real-Time data 113 is provided to a data recorder 114, which  
21 provides the means for recording data for later review and analysis, and to a data  
22 modeling processor and process 117. In the preferred embodiments of this invention the  
23 data recorder 114 uses processor controlled digital memory, and the data modeling

1 processor and process 117 is one or more digital computer devices, each having a  
2 processor, memory, display, input and output devices and a network connection. The  
3 data recorder 114 provides the recorded data to a speed controller 115, which permits the  
4 user to speed-up or slow-down the replay of recorded information. Scalar manipulations  
5 of the time (speed) in the context of the 3-D modeling of the dynamic recorded digital  
6 data allows for new and improved methods or reviewing the health of the system 110a,b.  
7 A customize / standardize function 116 is provided to permit the data modeling to be  
8 constructed and viewed in a wide variety of ways according to the user's needs or  
9 intentions. Customization 116 includes the ability to modify spatial scale (such  
10 modification including, but not limited to translating, rotating, and zooming), attributes,  
11 other structural and symbolic parameters, and viewports in addition to speed. The range  
12 of customization from monitoring artificial systems' 110a,b states is wide and not as  
13 standardized as that used in the preferred embodiment of the natural system 101a,b  
14 monitoring. In this Free Customization, the symbolic system and display method is fully  
15 adaptable to the user's needs and interests. Although this invention has a default  
16 visualization space, its rules, parameters, structure, time intervals, and overall design are  
17 completely customizable. This interface mode customize/standardize function 116 also  
18 allows the user to select what information to view and how to display the data. This  
19 interface mode customization 116 may, in some preferred embodiments, produce  
20 personalized displays that although they may be incomprehensible to other users,  
21 facilitate highly individual or competitive pursuits not limited to standardized  
22 interpretations, and therefore permit a user to look at data in a new manner. Such  
23 applications as analysis of stock market data or corporation health monitoring may be

1 well suited to the flexibility of this interface mode. The data modeling processor and  
2 process 117 uses the prescribed design parameters, the customize/standardized function  
3 116 and the received real-time data 113 to build a three-dimensional (3-D) model in time  
4 and to deliver it to a display. The display of the data modeling processor and process  
5 117 presents a representation 118 of 3-D objects in 3-D space in time to provide the  
6 visual representation of the health of the artificial system 110a in time, or as in the  
7 described instances of the simulated 110b system.

8 Figure 1c is a top-level block diagram of one preferred processing path of this  
9 invention. Sensors 119 collect the desired signals and transfer them as electrical impulses  
10 to the appropriate data creation apparatus 120. The data creation apparatus 120 converts  
11 the received electrical impulses into digital data. A data formatter 121 receives the  
12 digital data from the data creation apparatus 120 to provide appropriate formatted data for  
13 the data recorder 122. The data recorder 122 provides digital storage of data for  
14 processing and display. A data processor 123 receives the output from the data recorder  
15 122. The data processor 123 includes a data organizer 124 for formatting the received  
16 data for further processing. The data modeler 125 receives the data from the data  
17 organizer and prepares the models for representing to the user. The computed models are  
18 received by the data representer 126, which formats the models for presentation on a  
19 computer display device. Receiving the formatted data from the data processor 123 are a  
20 number of data communication devices 127, 130. These devices 127, 130 include a  
21 central processing unit, which controls the image provided to one or more local displays  
22 128, 131. The local displays may be interfaced with a custom interface module 129

1 which provides user control of such attributes as speed 131, object attributes 132,  
2 viewports 133, zoom 134 and other like user controls 135.

3 Figure 1d is a top-level block diagram of a second preferred processing path of  
4 this invention. In this embodiment of the invention a plurality of entities 136a,b,c are  
5 attached to sensors 137a,b,c which communicate sensor data to a data collection  
6 mechanism 138, which receives and organizes the sensed data. The data collection  
7 mechanism 138 is connected 139 to the data normalize and formatting process 140. The  
8 data normalize and formatting process 140 passes the normalized and formatted data 141  
9 to the distributed processors 142. Typically and preferably the processing 142 is  
10 distributed over the Internet, although alternative communication networks may be  
11 substituted without departing from the concept of this invention. Each processing unit  
12 142 is connected to any of the display devices 143a,b,c and receives command control  
13 from a user from a number of interface units 144a,b,c, each of which may also be  
14 connected directly to a display devices 143a,b,c. The interface units 144a,b,c receive  
15 commands 145 from the user that provide speed, zoom and other visual attributes  
16 controls to the displays 143a,b,c.

17 Figures 2a, 2b, 2c, and 2d are representative 3-D objects representing critical  
18 functions. Each 3-D object is provided as a symbol for a critical function of the entity  
19 whose health is being monitored. The symbol is created by selecting the interdependent  
20 variables that measure a particular physiologic function and expressing the variable in  
21 spatial (x,y,z) and other dimensions. Each 3-D object is built from 3-D object primitives  
22 (i.e., a cube, a sphere, a pyramid, a n-polygon prism, a cylinder, a slab, etc.). More  
23 specifically, the spatial dimensions (extensions X, Y and Z) are modeled after the most

1 important physiologic variables based on (1) data interdependency relationships, (2) rate,  
2 type and magnitude of change in data flow, (3) geometric nature and perceptual potential  
3 of the 3-D object, for example a pyramid versus a cylinder, (4) potential of the object's  
4 volume to be a data-variable itself by modeling appropriate data into x, y and z  
5 dimensions (e.g., in one preferred application of the invention, cardiac output is the result  
6 of heart rate (x and y dimensions) and stroke volume (z)), (5) orthographic viewing  
7 potential (see viewport) and (6) the relationship with the normal values framework.

8       The first representative object 201, shown in figure 2a, is an engine process. The  
9 object 201 representing this process is provided on a standard x-y-z coordinate axis 202.  
10 The correlation between temperature, shown in the x1-dimension 204, engine RPM,  
11 shown in the y1-dimension 205 and exhaust gas volume, shown in the z1-dimension 203  
12 is shown by changes in the overall sizes and proportion of the object 201. In the shown  
13 example object 201 the engine gas volume 203 is large, when RPM 205 is low and the  
14 engine temperature 204 is in the middle range. This combination of values, even without  
15 specific identified values suggests an engine's starting point.

16       The second representative object 206, shown in figure 2b, is an object  
17 representing cardiac function using stroke volume, in the y2-dimension 209, and the heart  
18 rate per second, shown as the x2, z2 dimensions. The total cardiac volume is shown as  
19 the total spherical volume 208.

20       The third representative object 211, shown in figure 2c, represents the interaction  
21 between the number of contracts, shown in the y3-dimension 212, the average revenue  
22 per contract, shown in the z3-dimension 214, and the average time per contract, shown in

1 the x3-dimension 213. Assessing the interaction among these variables is important in  
2 monitoring of a sales department's operations.

3 The fourth representative object 215 is shown in figure 2d, shows the respiratory  
4 function generated by the respiratory rate, shown in x4-dimension 216, the respiratory  
5 volume, shown in the y4-dimension 216, and inhalation / exhalations, shown in the z4-  
6 dimension 218.

7 Figure 3 is a representation of data objects in H-space 301. Data sets are  
8 represented as 3-D objects of various characteristics and relationships within a 3-D  
9 representation space. The data representation environment in this figure is used to map  
10 the physiologic data in 3-D and is what is referred to as "Health-space" or "H-space" 301.

11 The 3-D objects are placed within H-space on the 3 coordinates of their geometric  
12 centers. The coordinates for an object's geometric center depends on the relevant data  
13 associated to the particular critical function the object represents. For example, in the  
14 preferred embodiment, the cardiac function object, shown as a spherical object 302, is  
15 placed in H-space 301 based on Mean Blood Pressure, designated as Oy 306 and Oxygen  
16 Saturation in the Blood, shown as Oz 307. In the other example object, the prism 309 is  
17 placed in H-space 301 depending on sales profit, shown as Py 312, and products in stock,  
18 shown as Pz, 311. The location of 3-D objects in H-space 301 allows for the overall  
19 extension envelope of H-space, the relationship between 3-D objects and spaces within  
20 H-space 301, the viewport display areas and the departure from normative values.  
21 Typically and preferably the centers of the objects 302, 309 are located in the middle of  
22 the x-dimension of H-space 301.

1 Figures 4a and 4b are representative views of changes in data objects in time. In  
2 figure 4a, the x-coordinate 400 is used to measure the temporal dimension of an objects  
3 402 trajectory. The y-z plane 401a determines the location of an object's geometric  
4 center within H-space. Increases or decreases in data values associated with the  
5 coordinates of the object's geometric center that make that object's location change in  
6 time as shown in path line 401b. In this view, the object 402 is presented in four different  
7 time intervals 403, 404, 405, 406, thereby creating a historical trajectory. The time  
8 intervals at which the object 402 is shown are provided 407. In figure 4b, increases in  
9 size and proportion are presented, 408, 409, 410, 411 providing an example of changes in  
10 values. The monitoring of these changes in time assists the user establish and evaluate  
11 comparative relationships within and across H-states.

12 Figures 5a, 5b, 5c, 5d, 5e, 5f, 5g and 5h are representative views of properties of  
13 data objects provided in the preferred embodiment of this invention. In addition to the  
14 three x-y-z spatial dimensions used for value correlation and analysis, 3-D objects may  
15 present data value states by using other geometric, aesthetic, and aural attributes that  
16 provide for the mapping of more physiologic data. These figures show some of the  
17 representative other geometric, aesthetic, and aural attributes supported for data  
18 presentation in this invention. Figure 5a shows changes in apparent volumetric density.  
19 A solid object 501 is shown in relation to a void object 502 and an intermediate state 503  
20 object. Figure 5b shows changes in apparent 3-D enclosure. An open object 504, a  
21 closed object 505, and an intermediate state 506 is shown. Figure 5c shows the apparent  
22 degree of formal deformation. A normal object 507, a distorted object 508, a transformed  
23 object 509, and a destroyed object 510 are shown in comparison. Figure 5d shows

1 secondary forms of the objects. "Needles" 513 protruding through a standard object 512  
2 in combination 511 is shown in comparison with a boundary 515 surrounding a standard  
3 object 514 and a bar 517 protruding into the original form object 518 forming a new  
4 combination object 516 are shown providing additional combination supported in this  
5 invention. Figure 5e shows the various degrees of opacity of the object's surface,  
6 showing an opaque object 519, a transparent object 520 and an intermediate state object  
7 521. Figure 5f shows the various degrees of texture supported by the object display of  
8 this invention, including a textured object 522, a smooth object 523 and an intermediate  
9 textured object 524. Figure 5g is intended to represent various color hue possibilities  
10 supported for objects in this invention. An object with color hue is represented 525 next  
11 to a value hue object 526 and a saturation hue object 527 for relative comparison.  
12 Naturally, in the actual display of this invention colors are used rather than simply the  
13 representation of color shown in figure 5g. Figure 5h shows the atmospheric density of  
14 the representation space possible in the display of objects in this invention. An empty-  
15 clear space 528, a full-dark space 530 and an intermediate foggy space 523 are shown  
16 with 3-D objects shown within the representative space 529, 531, 533.

17 Aural properties supported in this invention include, but are not limited to pitch,  
18 timbre, tone and the like.

19 Figure 6 shows the 3-D configuration of the objects in H-space in the preferred  
20 embodiment of the invention. In this view the local level, H-space 601 is shown within  
21 which the 3-D objects 602, 603, and 604 are located. Object 602 represents the  
22 respiratory function of an individual. Its 602 x-y-z dimensions change based on the  
23 parameter-based dimensional correlation. The object 603 represents the efficiency of the

1 cardiac system by varying the x,y,z coordinates of the object. The object 604 represents a  
2 human brain function, also with the x,y,z dimensions changing based on the parameter-  
3 based dimensional correlation. In this way the user can easily view the relative  
4 relationships between the three physiological objects 602, 603, 604. Within H-space 601,  
5 the temporal coordinate (i.e., periodic time interval for data capturing that defines how H-  
6 space is plotted in Live-space – see figure 7) is a spatial dimension on which data is  
7 mapped. The x-dimension of 605 of the H-space 601 can be mapped to another  
8 independent variable such as heart rate period, blood pressure or the like. The location of  
9 an object in the y-dimension 606 of H-space 601 can be mapped to additional variables  
10 that are desired to be monitored such as SaO<sub>2</sub> content, CaO<sub>2</sub> content, or temperature in  
11 the blood. The location of an object in the z-dimension 607 of the H-space 601 can also  
12 be mapped to additional variables that the user desires to monitor. A hypothetical object  
13 608 shows that the three coordinates are contextual to a particular object 608 and need  
14 not be the same for all objects, except in the object's 608 extension measuring properties.  
15 Fixed x- and z-dimension values 609a and 609b are shown as constant. The y-value 610  
16 of this object 608 changes to fluctuating values or data type that results in the height of  
17 the object 608 increasing or decreasing. This view shows another object 611 showing the  
18 relationship between the three dimensions. Constant x- and y-values 612a and 612b are  
19 shown. The z-value 613 of this object 611 changes to fluctuating values or data types  
20 that result in the width of the object 611 increasing or decreasing. An overlapping view  
21 614 of an object 615 that has extended past the H-space limitation. A limit of H-space  
22 616 with a spherical object 617 located inside H-space 616 shown with the degree of  
23 extension shown in shaded circles.

1       Figure 7 shows a series of H-spaces 701, 702, 703, 704, 705, 706 along a global  
2 time coordinate 708, and the local-space coordinates 707 that governs each H-space.  
3       Each of these H-spaces represents progressive states of the dynamic system at pre-  
4 established temporal intervals ( $T_0, T_{-1}, T_{-2}, \dots, T_n$ ) and the six 701, 702, 703, 704, 705,  
5 706 together show the evolution of that system over time, demonstrating the historical  
6 representation of individual H-states within an overall “Life-space” or “L-space.” At the  
7 global level (or L-space), one of the coordinates, typically x, is always time. The  
8 temporal coordinate is scaled based on the intervals at which a particular functions  
9 system’s physiologic data are collected by the art or as appropriate. This interval or  
10 module is fixed and constant across L-space and provides the necessary temporal frame  
11 of reference for comparing different H-spaces. The fixed temporal interval also  
12 determines the maximum x-extension of the representation envelope of H-space. The  
13 other two coordinates, y and z, provide L-space with extension and are not fixed. The  
14 three coordinates thus described provide a regulating 3-D environment within which the  
15 H-states can be visualized and related to each other.

16       Figures 8a and 8b show the global level coordinate system of the preferred  
17 embodiment of this invention. Figure 8a shows the L-space coordinate system 801 in its  
18 preferred embodiment. The x-dimension 802 of L-space is mapped to a constant time  
19 interval , set by means standard in the art or otherwise as appropriate. The present  
20 position of H-state is also indicated on the x-dimension 802. The y-dimension 803 in  
21 both positive and negative extensions is measured, up and down from the x-axis. This  
22 dimension 803 can be mapped to a data variable within particular 3D object in space.  
23 The z-dimension 804 is shown in both positive and negative extensions measured

forwards and backwards from the intersecting x-axis. This dimension 804 can be mapped to a data variable within a particular 3D object in space. Now for figure 8b a prismatic object 800 represents a critical function, whose evolution is being monitored in L-space, of a given dynamic system. The front view 805 shows the different H-states of the prism/function 800 using a time T to T-n historical trend. The level of intersection and separation between the front views of the prism indicate abnormal health states of the critical function the object 800 represents. No separation or intersection shows normal function conditions. The trajectory in the y-dimension of the prism (i.e., H-states of the critical function) are mapped to a variable that cause their relative position to change in the + and -y dimension. The current state 806 of the prism is shown in this front view 805. A top view of 809 of the three-dimensional L-space is shown, showing the evolution of the prism 800 backward in time and showing a T to T-N historical trend. The level of intersection and separation indicate abnormal health states of the particular critical function the prism represents. No separation or intersection shows normal conditions. The trajectory in the z-dimension of the object is mapped to a variable that causes their position to change in the + and -z dimension. This top view shows both the z and y trajectories in one comprehensive view. The perspective view 808 of L-space gives a comprehensive view of the interaction of the prisms (the H-states of the function) and their movement in all dimensions. The side view 807 of L-space shows the prisms and their positions in L-space giving a simultaneous view of z and y trajectories.

Figures 9a and 9b shows various viewpoints in which the data may be visualized in the preferred embodiment of this invention. This figure shows representations of a data object (a prism) and is provided to show that there are two basic types of viewports:

1 orthographic and perspectival. The orthographic viewports 906, 907, 908, of figure 9b  
2 use a parallel system of projection to generate representations of H-space that maintains  
3 dimensional constancy without deformation. Some examples of orthographic views  
4 include traditional architectural or engineering views of objects, such as a top view, a  
5 front view, and a side view. The orthographic viewport allows for accurate and focused  
6 2-D expressions of the actual 3-D object. The perspectival viewport 909, shown in figure  
7 9b uses a focal system of projection to generate depictions analogous to our perception of  
8 reality but at the cost of deformation and lack of dimensional constancy. For example,  
9 the top view 902 along with the side view 903 and the front view of 904 of the 3-D data  
10 object 901 are shown in figure 9a. Figure 9b shows three orthogonal views 906, 907, 908  
11 along with a perspective view 909 of the current data object. The number and types of  
12 viewports used in a particular embodiment of the invention may range from one type, for  
13 example a perspective viewport allowing immerse virtual reality, to combinations of both  
14 types. In the preferred current embodiment, there are the four viewports shown in figure  
15 9b. Given the 3-D nature of data objects and H-space, viewports provide the user with  
16 different depictions of the same data.

17 Figure 10 shows the transform of an object in space in context, with a reference  
18 framework, in the preferred embodiment of this invention. The referential framework  
19 1010 is typically set based on population normals or patient normals. This framework  
20 assists the user to see deviations from normal very quickly. An individual spherical  
21 object 1011 that represents cardiac function is shown located in L-space and in relation to  
22 the referential framework. A side view 1012 is shown along with several cardiac objects.  
23 In this view the referential framework provides a center target point so that a user can

1 make the necessary corrections to bring the object back to the ideal center of the  
2 framework. A perspectival view 1013 of the framework is also shown along with several  
3 cardiac objects. The top view 1014 of the framework is shown with several spherical  
4 objects (representing cardiac states). This figure demonstrates the variety of viewports  
5 provided to the user by this invention, which provides enhanced flexibility of analysis of  
6 the displayed data.

7 Figure 11a shows the zooming out function in the invention. This invention  
8 provides a variety of data display functions. This figure shows the way views may be  
9 zoomed in and out providing the relative expansion or compression of the time  
10 coordinate. Zooming out 1101 permits the user to look at the evolution of the system's  
11 health as it implies the relative diminution of H-states and the expansion of L-space. This  
12 view 1101 shows a zoomed out view of the front view showing a historical view of many  
13 health states. A side view 1102 zoomed out view is provided to show the historical trend  
14 stacking up behind the current view. A 3-D perspectival, zoomed out view 1103 showing  
15 the interaction of H-states over a significant amount of time is provided. A zoomed out  
16 top view 1104 shows the interaction of H-states over a large amount of time.

17 Figure 11b shows the zooming in function of the invention. The zooming in front  
18 view 1105 is shown providing an example of how zooming in permits a user to focus in  
19 on one or a few H-states to closely study specific data to determine with precision to the  
20 forces acting on a particular H-state. A zoomed in side view 1106 is provided showing  
21 the details of specific variables and their interactions. A zoomed in 3-D perspective view  
22 1107 of a few objects is also shown. Also shown is a zoomed in top view 1108 showing  
23 the details of specific variables and their interaction.

1 Figures 12a shows a 3-D referential framework of normative values that is  
2 provided to permit the user a direct comparison between existing and normative health  
3 states, thereby allowing rapid detection of abnormal states. The reference framework  
4 1201 works at both the global L-space level and the local H-space level. “Normal”  
5 values are established based on average historical behavior of a wide population of  
6 systems similar to the one whose health is being monitored. This normal value  
7 constitutes the initial or by-default ideal value, which , if necessary may be adjusted to  
8 acknowledge the particular characteristics of a specific system or to follow user-  
9 determined specifications. The highest normal value of vital sign “A” 1202 (+y) is  
10 shown, along with the lowest normal value of “B” 1203 (-z), the lowest normal value of  
11 vital sign “A” 1204 (-y) and the highest normal value of vital sign “B” 1205 (+z). In  
12 figure 12b, abnormal values of “A” and “B” are shown in an orthogonal view. An  
13 abnormally high value of “A” 1206, an abnormally low value of “B” 1207, an abnormally  
14 low value of “A” 1208 and an abnormally high value of “B” 1209 are shown.

15 Figure 13 shows a comparison of the interface modes of the preferred  
16 embodiment of this invention. This invention provides two basic types of interface  
17 modes: (a) standardized or constrained customization; and (b) free or total customization.  
18 Each is directed toward different types of applications. The standardized or constrained  
19 customization 1301 uses a method and apparatus for user interface that is set a-priori by  
20 the designer and allows little customization. This interface mode establishes a stable,  
21 common, and standard symbolic system and displaying method that is “user-resistant”.  
22 The fundamental rules, parameters, structure, time intervals, and overall design of L-  
23 space and H-space are not customizable. Such a normalized symbolic organization

1 creates a common interpretative ground upon which different users may arrive at similar  
2 conclusions when provided common or similar health conditions. This is provided  
3 because similar data flows will generate similar visualization patterns within a  
4 standardized symbolic system. This interface method is intended for social disciplines,  
5 such as medicine in which common and agreeable interpretations of the data are highly  
6 sought after to ensure appropriate and verifiable monitoring, diagnosis and treatment of  
7 health states. The customization permitted in this mode is minimal and is never  
8 threatening to render the monitoring device incomprehensible to other users.

9           The free or total customization interface mode 1302 provides a symbolic system  
10 and displaying method that is changeable according to the user's individual needs and  
11 interests. Although the invention comes with a default symbolic L-space and H-space, its  
12 rules, parameters, structure, time intervals, and overall design are customizable. This  
13 interface mode also permits the user to select what information the user wishes to view as  
14 well as how the user wishes to display it. This interface mode may produce personalized  
15 displays that are incomprehensible to other users, but provides flexibility that is highly  
16 desired in individual or competitive pursuits that do not require agreeable or verifiable  
17 interpretations. Examples of appropriate applications may include the stock market and  
18 corporate health data monitoring.

19           Figure 14 is a hardware system flow diagram showing various hardware  
20 components of the preferred embodiments of the invention in a "natural system" medical  
21 application. Initially a decision 1401 is made as to the option of using data monitored on  
22 a "real" system, that is a real patient, or data from the simulator, for anesthesiology  
23 training purposes. If the data is from a real patient, then the patient 1402 is provided with

1 patient sensors 1404, which are used to collect physiological data. Various types of  
2 sensors, including but not limited to non-invasive BP sensors, ECG leads, SaO<sub>2</sub> sensors  
3 and the like may be used. Digital sensors 1416 may also provide physiological data. An  
4 A/D converter 1405, is provided in the interface box, which receives the analog sensor  
5 signals and outputs digital data to a traditional patient monitor 1406. If the data is  
6 produced 1401 by the simulator 1403, a control box and mannequins are used. The  
7 control box controls the scenarios simulated and the setup values of each physiological  
8 variable. The mannequins generate the physiological data that simulates real patient data  
9 and doctors collect the data through different, but comparable sensors. The traditional  
10 patient monitor 1406 displays the physiological data from the interface box on the screen.  
11 Typically and preferably, this monitor 1406 is the monitor used generally in an ICU. A  
12 test 1407 is made to determine the option of where the computations and user interface  
13 are made, that is whether they are made on the network server 1408 or otherwise. If a  
14 network server 1408 is used, all or part of the data collection and computation may be  
15 performed on this computer server 1408. An option 1409 is proved for running a real  
16 time representation versus a representation delayed or replayed from events that  
17 previously occurred. For real time operation, a data buffer 1410 is provided to cache the  
18 data so that the representation is played in real time. For the replay of previous events, a  
19 data file 1411 provides the means for permanently storing the data so that visualization is  
20 replayed. The visualization software 1412 runs on a personal computer and can display  
21 on its monitor or on remote displays via the internet or other networking mechanism.  
22 Typically the physiological data measured on either a real patient or the simulator are fed  
23 to the personal computer from the traditional data monitor. A standard interface such as

1 RS232, the Internet, or via a server, which receives data from the monitor, may serve as  
2 the communication channel to the personal computer running the visualization software  
3 1412. This program 1412 is the heart of the invention. The program 1412 computes the  
4 representation and processes the user interface. An option 1413 is provided for  
5 computing and user interface on the local desktop personal computer or for distribution  
6 across the Internet or other network mechanism. If a local desktop personal computer is  
7 selected, the personal computer 1414 with an adequate display for computation of the  
8 visualization and user interface is provided. If a remote user interface 1415 is selected  
9 the display and user interface is communicated across the Internet.

10 Figure 15 is a software flow chart showing the logic steps of a preferred  
11 embodiment of the invention. The preferred embodiment of this invention begins by  
12 reading the startup file 1501, which contains the name of the window and the properties  
13 associated with the invention. The properties associated with the a window include  
14 formulas to set object properties, text that is to be rendered in the scene, the initial size of  
15 the window, the initial rotation in each window, zoom, lighting and patient data that  
16 describes the normal state of each variable. Internal data tables are next initialized 1502.  
17 For each new window encountered in the startup file a new window object is made and  
18 this window object is appended to the list of windows. The window object contains an  
19 uninitialized list of properties describing the state of the window, which is filled with data  
20 from the startup file. The event loop is entered 1503. This is a window system  
21 dependent infinite loop from which the program does not exit. After some initialization,  
22 the program waits for user input and then acts on this input. The program then takes  
23 control of the event loop for continuous rendering that is if there is no interactivity in the

1 program. Initialization 1504 of windows is next performed. This involves calls to the  
2 window system dependent functions (these are functions that are usually different on  
3 different computational platforms) that creates the windows and displays them on the  
4 computer screen. In the current preferred embodiment of the invention, OpenGL is  
5 required, although alternative embodiments using other 3D application programming  
6 interfaces, such as PEX or DirectX, could be substituted without departing from the  
7 concept of this invention. Also, in the preferred embodiment of this invention, a personal  
8 computer graphics card is preferred in the personal computer so as to permit smooth  
9 animation with multiple windows. Although the lack of such a card is not absolutely  
10 required for operation of this invention. New data is received 1509, typically from the  
11 data file 1506 or the data buffer 1507. This new data 1509 can come from any source  
12 that generates floating-point numbers. The preferred line of data is composed of columns  
13 of floating point numbers separated by space. At this point the current time is also stored  
14 so that the next line of data can be obtained at the next user defined time interval, which  
15 is typically set at about 1 second. Object properties are next computed 1510. This is  
16 performed by using formulas that are specified in the startup file to compute properties of  
17 objects. Data fields in the formulas are specified by writing the column number preceded  
18 by a dollar sign. For example, \$1 / 20.0 would divide the first field by 20.0. The specific  
19 properties in this application are: cardiac object dimensions, material properties, and  
20 position. Material properties can include the red, green, and blue components as they  
21 appear under ambient, diffuse, and specular light, as well as transparency. The cardiac  
22 object position includes the y and z positions as well as an x shift. If four or more lines  
23 of data have been acquired, the respiratory object properties are computed. A delay is

1 necessary because a cubic spline is fitted, using four data points to do the fit, to the data  
2 points to generate a smooth respiratory object. Therefore, until four time steps have  
3 passed, the curtain is not rendered. Thereafter, it is rendered every time new data is  
4 acquired. Cardiac object properties include material properties and the height of the color  
5 bands. Blood pressure object length and materials are the thin cylinders that go through  
6 the top and bottom of each ellipsoid. Next, reference grid properties are computed. All  
7 objects, except the cardiac object reference are stationary, in the current implementation.  
8 The cardiac object reference can move according to the movement of the cardiac object if  
9 the user specifies this movement in the startup file. Next, sounds are computed 1511 and  
10 made audible 1513. Objects and reference grids are rendered 1512. Before rotation the  
11 newest object appears at the right side of the screen and oldest object is at the left side of  
12 the screen. Sound is produced 1513 next. A test 1514 is next made to determine if  
13 smooth animation is selected. If smooth animation is selected the scene will scroll during  
14 the time the program is waiting to get new data. The program, using available computing  
15 resources, selects the minimum time increment so that the shift of the objects can be  
16 rendered within the increment, but limiting the increment to the smallest increment that  
17 human eyes can detect. If smooth animation is not selected, objects are shifted to the left  
18 1515 such that the distance from the center of the newest cardiac object to that of the  
19 former cardiac object is equal to the inter-cardiac spacing. The process waits 1508 until  
20 the current time minus the time since data was last obtained equals the data acquisition  
21 period specified by the user. If the current time minus the time when the data was last  
22 acquired equals the user specified data acquisition period then a new line of data is  
23 acquired. If smooth animation is selected, then the cardiac objects are shifted to the left

1 by computing 1516 to that when it is time to get the next line of data, the cardiac objects  
2 have moved 1517, 1518 such that the distance from the rightmost cardiac object to the  
3 position where the new cardiac object will appear is equal to the inter-cardiac-object  
4 distance. For example, if it takes 0.20 seconds to render the previous scene, the period of  
5 data acquisition is 1.0 seconds, and the x shift of the rightmost cardiac object is 0.1 units  
6 then the program will shift the scene left  $(0.20 / (1.0 + 0.20) * (1.0 - 0.1)) = 0.15$ . The  
7 formula in the denominator is  $(1.0 + 0.20)$  instead of 0.8 because, if the scene has been  
8 shifted left such that, when new data is acquired, the shifting has stopped (because the  
9 position of the cardiac objects satisfies the criteria that the distance from the center of the  
10 rightmost cardiac object to the center point where the new cardiac object will be rendered  
11 = 1 unit) then the animation will no longer be smooth, that is, when new data is acquired  
12 the animation will appear to stop. Note, that the respiratory object is never entirely  
13 smoothly shifted because no data is available to render the object at the intermediate time  
14 steps.

15       Figure 16 is a software block diagram showing the logic steps of the image  
16 computation and rendering process of a preferred embodiment of the invention. This  
17 process begins with acquiring the window identification 1601 of the current rendering  
18 context. Next, the data structure is found 1602 corresponding to the current window  
19 identification. After which, the view is set 1603. A rotation matrix is set 1604. A  
20 projection matrix is set 1605. Lights are set 1606. The back buffer is cleared 1607.  
21 Object processing 1608 begins, and includes for each cardiac object, calling OpenGL to  
22 see material properties; shift left one inter-cardiac-object distance; push the modelview  
23 matrix, shift x,y, and z directions; call OpenGL utility toolkit to render the cardiac object;

1 set the top cardiac object material properties, call OpenGL quadries function to render top  
2 cardiac object; set top cardiac object material properties, call OpenGL quadrics function  
3 to render bottom cardiac object and pop modelview matrix. Next, the view is set 1609, as  
4 above. The respiratory object is rendered 1610, by setting OpenGL to render quad strips,  
5 for each polygon strip set material properties, and send vertex to OpenGL. Reference  
6 grids are rendered 1611 by setting material property of the cardiac reference grid. The  
7 current position is set 1612 to be the ideal position of the newest cardiac object, that is the  
8 position corresponding to a patient in ideal health. The cardiac object material properties  
9 are set 1613. The OpenGL utility toolkit is called to render 1614 the cardiac object.  
10 Next, OpenGL is set to render quads 1615. After which the material properties of the  
11 reference planes are set 1616. Vertices that compose the reference planes through the  
12 OpenGL pipeline are sent 1617 and buffers are swapped 1618. Buffer swap is a window  
13 system defendant function.

14 Figure 17 is a photograph of the 3-dimensional display of a preferred embodiment  
15 of the invention. The 3-D view shown at lower right 1706 provides a comprehensive,  
16 integrated and interactive view of all physiological data, and shows the interaction  
17 between the different objects in relation to the reference frame. This view can be  
18 manipulated by the user to fit specific application needs. The front 1701, side 1704, 1705  
19 and top views 1702 show how the same data appears from different vantage points. In  
20 this figure these views 1701, 1702, 1704, 1705 show the interaction between the cardiac  
21 object, the reference frame and the respiratory object, with the side view 1704 providing  
22 a target for optimum efficiency of the cardiac system 1705 shows the level of gas  
23 concentration in the lungs and overall tidal volume in the respiratory system. This figure

1 17 is a representation of a true 3-D model of the physiologic data. The circle 1703  
2 shown is the top view of the respiratory waveform showing CO<sub>2</sub> content in the lungs and  
3 inspiration and expiration values. In 1703, a real time display, the object grows and  
4 shrinks with each heartbeat. Its height is proportional to the heart's volume output and its  
5 width is proportional to heart rate. The gridframe (or reference framework) shows the  
6 expected normal values for stroke volume and heart rate. The position of this object in  
7 the vertical direction of the display is proportional to the patient's mean blood pressure.  
8 This graphic objects shape and animation provides a useful graphical similarity to a  
9 working heart. In the preferred embodiment, the background is colored to show inspired  
10 and expired gases. The height of the "curtain" is proportional to tidal volume, while the  
11 width is proportional to respiratory rate. The colors, which are, displayed in the preferred  
12 display show the concentrations of respiratory gases. Time is set to move from right to  
13 left, with the present or current conditions shown at the "front" or right edge of each  
14 view. Past states remain to provide a historical view of the data.

15 Figure 18 is a close-up front view of the cardiac object and the associated  
16 reference framework of a preferred embodiment of the invention. The upper limit of  
17 normal blood pressure value is shown 1800 on the reference frame. The systolic blood  
18 pressure level is indicated by the bar 1801 penetrating the cardiac sphere 1806. The  
19 height 1802 of the sphere 1806 is proportional to cardiac output, which shows the  
20 optimum efficiency of the heart. The width of the sphere 1806 is proportional to 1/heart  
21 rate. The elevation of the sphere 1806 is an indication of mean blood pressure, where the  
22 center reference gridline is a normal mean blood pressure 1803. The lower limit, or  
23 diastolic blood pressure 1804 is shown by the length of the bar extending downward from

1 the sphere 1806. Previous historical values for the sphere 1806 are also provided in  
2 1805, 1807.

3 Figure 19 is a view of the front view portion of the display of a preferred  
4 embodiment of the present invention showing the cardiac object in the foreground and  
5 the respiratory object in the background. This view 1900 provides a more quantitative  
6 image of the hemodynamic variables, stroke volume, blood pressure 1901 and heart rate.  
7 The “normal” reference lines are more apparent. In the preferred embodiment,  
8 respiration is shown by changes in the background color.

9 Figure 20 is a view of the top view portion of the display 2000 of a preferred  
10 embodiment of the present invention showing the cardiac object toward the bottom of the  
11 view and the respiratory object toward the top of the view. Inhaled gas 2002 and  
12 exhaled gas 2003. CO<sub>2</sub> concentrations and oxygen saturation of the arterial blood 2001  
13 versus time are also shown.

14 Figure 21 is a view of the side view portion of the display of a preferred  
15 embodiment of the present invention showing the cardiac object to the left and the  
16 respiratory object to the right. Gas concentration in the lungs 2101, a calibrated scale for  
17 gas concentration 2103, blood pressure 2100, and oxygen saturation 2101 are shown.

18 The end view, shown here in figure 21, is especially useful during treatment, where the  
19 goal is to bring the variables back to the center or normal state. Functional relationships  
20 can be added to this view to predict how treatment can be expected to bring the variables  
21 back to normal.

22 Figure 22 is a view of the 3-D perspective view portion of the display of a  
23 preferred embodiment of the present invention showing the cardiac object in the left

1 foreground and the respiratory object in the right background. This view 2200 provides  
2 a comprehensive, integrated and interactive view of nine physiological variables. The  
3 sphere 2201 grows and shrinks with each heartbeat. Its height is proportional to the  
4 heart's stroke volume and its width is proportional to heart rate. This graphic object 2201  
5 offers useful similarity to a beating heart. The gridframe 2202 shows the expected  
6 normal values for stroke volume and heart rate. The position of this object 2201 on the  
7 screen is proportional to the patient's mean blood pressure. The ends of the bar 2203  
8 drawn vertically through the center of the heart object show systolic and diastolic blood  
9 pressure. In the preferred embodiment of the invention, the background 2204 is colored  
10 to show inspired and expired gases. The height of the "curtain" 2205 is proportional to  
11 tidal volume. The width of each fold 2206 is proportional to respiratory rate. In the  
12 preferred embodiment colors are used to show the concentrations of respiratory gases.  
13 Time moves from right to left with the present condition shown at the "front" or right  
14 edge of the view 2200. Past states 2207 remain to permit a historical view of the data.

15 Figure 23a shows the preferred graphic element of this invention depicting a  
16 normal cardiovascular system. This graphic element 2300 is composed of a number of  
17 distinct objects 2301, 2301, 2303, 2304, 2305, 2306. Normal, or expected object  
18 represented values are shown by the filling of an object in its designated frame 2301,  
19 2301a, 2303a, 2304a, 2305a, 2306a. Numeric values 2307a-e are also shown to provide  
20 numeric indications of the desired graphic object. Although shown here as black objects  
21 within a white frame, in alternative embodiments the objects and frames may be any  
22 desired displayable color, texture, shading and the like.

1       Figure 23b shows the preferred graphic element of this invention depicting a  
2       cardiovascular system exhibiting anaphylaxis. This figure demonstrates the display of  
3       objects 2308, 2309, 2312 having values substantially less than desired or expected, by  
4       failing to fill the expected frame 2308a, 2309a, 2312a. An object 2313 having a value  
5       much larger than desired or expected is shown by overfilling its frame 2313a. Objects  
6       2310, 2311 having expected values is shown by filling their respective frames 2310a,  
7       2311a. Two sloped regions 2314, 2315 are provided to show a change in value between  
8       two objects.

9       Figure 23c shows the preferred graphic element of this invention depicting a  
10      cardiovascular system exhibiting hypovolemia. This figure demonstrates the display of  
11      objects 2316, 2317, 2318, 2319, 2320, 2321 having values substantially less than desired  
12      or expected, by failing to fill the expected frame 2316a, 2317a, 2318a, 2319a, 2320a,  
13      2321a. Three sloped regions 2322, 2323, 2324 are provided to show a change in value  
14      between two objects.

15      Figure 23d shows the preferred graphic element of this invention depicting a  
16      cardiovascular system exhibiting bradycardia. This figure demonstrates the display of  
17      objects 2329, 2330 having values substantially less than desired or expected, by failing to  
18      fill the expected frame 2329a, 2330a. Objects 2326, 2327 having a value much larger  
19      than desired or expected is shown by overfilling its frame 2326a, 2327a. And an object  
20      2325 having an expected value is shown by filling its respective frame 2325a. Three  
21      sloped regions 2331, 2332, 2333 are provided to show a change in value between two  
22      objects.

1       Figure 23e shows the preferred graphic element of this invention depicting a  
2       cardiovascular system exhibiting ischemia. This figure demonstrates the display of  
3       objects 2338, 2339 having values substantially less than desired or expected, by failing to  
4       fill the expected frame 2338a, 2339a. An object 2336 having a value much larger than  
5       desired or expected is shown by overfilling its frame 2336a. Objects 2334, 2335 having  
6       expected values is shown by filling their respective frames 2334a, 2335a. Two sloped  
7       regions 2340, 2341 are provided to show a change in value between two objects.

8       Figure 23f shows the preferred graphic element of this invention depicting a  
9       cardiovascular system exhibiting pulmonary embolism. This figure demonstrates the  
10      display of objects 2343, 2344, 2345, 2346, 2347 having values substantially less than  
11      desired or expected, by failing to fill the expected frame 2343a, 2344a, 2345a, 2346a,  
12      2347a. An object 2342 having a value much larger than desired or expected is shown by  
13      overfilling its frame 2342a. Two sloped regions 2348, 2349 are provided to show a  
14      change in value between two objects.

15      Figure 24 shows the preferred reference grid of this embodiment of this invention.  
16      A reference grid 2400 is provided within which space is allocated for graphic objects  
17      2401, 2402, 2403, 2404.

18      Figure 25 shows the preferred reference grid 2400 of this embodiment of this  
19      invention with the preferred object placement 2501, 2502, 2503, 2504 as well as a center  
20      line axis point 2500 indicated. Generally the center line axis 2500 is used to scale the  
21      object from a center point. Smaller objects, such as 2502, indicates lower values. While  
22      larger objects, such as 2503, indicates larger values.

1       Figure 26 shows the preferred reference frame 2400 of this embodiment of this  
2 invention with the preferred object relationships indicated. This figure provides the  
3 placement of objects identified with specific physical processes. For example, object  
4 2601 is CVP, object 2602 is PAP, object 2603 is LAP, object 2604 is HR SV and object  
5 2605 is MAP. In alternative applications of this invention, different physical processes  
6 can be assigned to the objects.

7       Figure 27 shows a representative three-dimensional object 2700 used in the  
8 present preferred embodiment of this invention. This preferred object 2700 is generally  
9 cylindrical in shape placed in a three-dimensional coordinate system 2701. Alternative  
10 object shapes are foreseeable and can be substituted without departing from the concept  
11 of this invention.

12       Figure 28 shows a representative view of the normalization of the present  
13 preferred embodiment of this invention. This figure shows the normalization of frames  
14 2801a-e set within a reference grid 2800.

15       Figure 29 shows and integrated view presenting numeric information 2901 in the  
16 present preferred embodiment of this invention set to associate with particular objects  
17 2902a-d within a reference frame 2900.

18       Figure 30 shows the addition of slope features 3004, 3005 to show the restriction  
19 of blood flow, designated in objects 3001, 3002, 3003, within a reference frame 3000.

20       It is to be understood that the above-described embodiments and examples are  
21 merely illustrative of numerous and varied other embodiments and applications which  
22 may constitute applications of the principles of the invention. Such other embodiments  
23 may be readily devised by those skilled in the art without departing from the spirit or

1 scope of this invention and it is our intent that they are deemed to be within the scope of  
2 this invention.

## CLAIMS

2 We claim:

3 1. A device for data representation, comprising:

4 (A) a reference grid;

5 (B) a first object frame, within said reference grid;

6 (C) a first object associated to said first object frame.

7 2. A device for data representation, as recited in claim 1, wherein said first object is  
8 associated with a cardiovascular function.

9 3. A device for data representation, as recited in claim 1, wherein said first object  
10 has a generally cylindrical shape.

11 4. A device for data representation, as recited in claim 1, further comprising a  
12 numeric value associated with said first object.

13 5. A device for data representation, as recited in claim 1, further comprising a  
14 second object frame placed within said reference grid.

15 6. A device for data representation, as recited in claim 5, further comprising a  
16 second object associated with said second object frame.

17 7. A device for data representation, as recited in claim 5, further comprising a sloped  
18 region positioned between said first object and said second object.

19

## ABSTRACT

2 A method, system , apparatus and device for the monitoring, diagnosis and  
3 evaluation of the state of a dynamic system is disclosed. This method and system  
4 provides the processing means for receiving sensed and/or simulated data, converting  
5 such data into a displayable object format and displaying such objects in a manner such  
6 that the interrelationships between the respective variables can be correlated and  
7 identified by a user. This invention provides for the rapid cognitive grasp of the overall  
8 state of a critical function with respect to a dynamic system. The system provides for  
9 displayed objects, which change in real-time to show the changes of the functions of the  
10 system. It is a highly flexible system which works with a wide variety of applications,  
11 including biological systems, environmental systems, engineering systems, economic  
12 systems, mechanical systems, chemical systems and the like. The device of this  
13 invention is adapted specifically to providing objects within a frame associated with other  
14 objects in a reference grid to provide a graphical representation of cardiovascular  
15 function.

TITLE: METHOD AND APPARATUS FOR MONITORING DYNAMIC CARDIOVASCULAR FUNCTION USING N-DIMENSIONAL REPRESENTATIONS OF CRITICAL FUNCTIONS

ATTORNEY DOCKET: 4315 P

Assistant Commissioner for Patents  
Box PATENT APPLICATION  
Washington, DC 20231

**DECLARATION FOR PATENT APPLICATION**

Honorable Assistant Commissioner:

As the below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe that I am an original, first and joint inventor of the subject matter which is claimed and for which a patent is sought on the invention entitled **METHOD AND APPARATUS FOR MONITORING DYNAMIC CARDIOVASCULAR FUNCTION USING N-DIMENSIONAL REPRESENTATIONS OF CRITICAL FUNCTIONS** the specification of which is attached hereto.

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, §1.56(a).

I hereby appoint Lloyd W. Sadler (Reg. No. 40,154) and Daniel P. McCarthy (Reg. No.

36,600) as my representatives and attorneys or agents to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith. All communications should be directed to Mr. Sadler at the following address or telephone number:

Lloyd W. Sadler  
MCCARTHY & SADLER, LC  
39 Exchange Place, Suite 100  
Salt Lake City, Utah 84111  
(801) 323-9399

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
